

```
https://query1.finance.yahoo.com/v7/finance/download/{stock_ticker}?  
period1=0&period2=9999999999&interval=1d&events=history
```

As of my last knowledge update in January 2022, here are the valid values for the `interval` and `events` parameters in the Yahoo Finance API when using the historical data download endpoint:

1. `interval`: This parameter specifies the interval between data points in the historical data. The valid values for the `interval` parameter include:

- `1d`: Daily data (1 day intervals)
- `1wk`: Weekly data (1 week intervals)
- `1mo`: Monthly data (1 month intervals)

You can choose the interval that suits your analysis or application needs.

2. `events`: The `events` parameter specifies the type of historical data you want to retrieve. Valid values for the `events` parameter include:

- `history`: Historical stock prices, including Open, High, Low, Close, and Volume.
- `div`: Dividend events.
- `split`: Stock split events.

To use the API for historical price data, you would typically use the `interval=1d` and `events=history` to get daily historical stock price data. For dividend and stock split events, you can use `events=div` and `events=split`, respectively.

Please note that the behavior and options of the Yahoo Finance API may change over time, so it's a good practice to check their official documentation or API endpoints for any updates or changes related to these parameters.
